

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

elevate, rather than cater to, the present standard of physical instruction in the schools. W.

[The 'master mind' was distinctly recognized, and its presence cheerfully acknowledged, in the review to which the above refers. The reviewer heartily joins his critic in his desire for a 'closer examination' to determine the justice of the comments made. Such an examination will unquestionably show that every criticism made in the review is well founded. It will be generally admitted that an explanation which needs explaining is not extremely satisfactory. The points under discussion are such as are not usually considered in books with which the teacher is likely to be familiar; and erroneous and confusing statements will generally be accepted, although not understood. The result must be disheartening, if not disastrous. It seems wiser, therefore, to warn him to be on the lookout for errors which have not been eliminated from this first edition, but which are not likely to be found in a second. And this is especially true of a book which contains as many really good and original things as the 'New physics,' and which carries the weight which naturally and necessarily goes with any thing Professor Trowbridge writes. — REV.]

The earthquake of Jan. 2.

Supposing that reasonably exact determinations of the time and character of seismic phenomena are useful, I send the following note on the shock of Jan. 2 at Washington.

I recognized the character of the shock at the instant of its occurrence, and timed it. On the following day, comparing my watch with one set to the standard (not local) time adopted for this city, I found the shock occurred at 9 h. 16 m. P.M., civil time, to which the correction to the Washington meridian is to be applied. My residence is close to Ascension church, on the highest land away from the boundaries of the city: the grade is ninety-two feet above mean level of the river, and two feet higher than the base of the capitol. I was in the third-story back room, facing east into the back-yard, and south into an alley. The house is of brick, and above the middle of the second story is isolated. The shock was a distinct and very heavy and sudden jar, not accompanied by noise, unless by a slight rattling of the windows, and lasted less than a second. The sensation was as if a very heavy body had struck the earth, yet also as if the jar were partly upward rather than downward. There was no second shock within fifteen minutes, although I saw a paragraph in the daily press to the effect that one individual alleges that he felt a second shock about 11 P.M. at Alexandria, Va. W. H. DALL.

Itinerant science-teachers.

In *Nature* for Dec. 25, 1884, there is described an 'itinerant method of science-teaching,' which "has been carried out on a large scale and with the most gratifying success by the school boards of Birmingham and Liverpool." A science demonstrator is appointed for a number of schools; and he is provided with apparatus, which is conveyed from school to school in a handcart 'by a strong youth.'

"The system," it is said, "fairly meets the objections which have been urged against the introduction of science-teaching, on the grounds of want of qualified teachers, want of time [to prepare for the lessons], and cost of apparatus. It also secures systematic and continuous teaching throughout the school-

year. The teaching is practical, and every fact or law is demonstrated experimentally."

Would it not be well to try a similar plan here?

J. R. W.

[It would answer in large centres, but would be limited in its application to places where it might be said to be least needed. — ED.]

The voice of serpents.

The text-books upon zoölogy represent that the vocal apparatus of serpents is very scantily developed, only enough to enable some of these creatures to hiss. A fact lately brought to my attention by Mr. George W. Leitch of Ryegate, Vt., is worthy of mention, and may lead herpetologists to search more carefully for the vocal apparatus of serpents. Mr. Leitch was stationed for several years at Manepy, Ceylon, as a missionary of the American board of commissioners for foreign missions. One day a serpent entered an apartment containing lumber, and it was deemed best to kill him. It became very angry, and made a loud noise, which Mr. Leitch says reminded him of the bellowing of a bull two years old. Perhaps others may know of instances in which these creatures make loud noises. This animal was of an uncommon variety, and was not preserved. It was of considerable size, say, seven or eight feet in length.

C. H. HITCHCOCK.

Hanover, N.H., Jan. 16.

The incandescent light on steamers.

In No. 102 of *Science*, in the article on 'Recent advances in electrical science,' Professor Trowbridge makes the statement that the Fall-River line took the initiative in adopting the incandescent system. This is certainly a mistake, as I myself saw it in full operation on the Virginia, of the Bay line (running between Baltimore and Norfolk), in the autumn of 1882, about a year before the Pilgrim was launched. Whether the Bay line was the first to adopt it or not, I do not know.

EVERETT HAYDEN.

U.S. geol. surv., Washington, D.C.,
Jan. 19.

Rainfall and crops.

Professor Snow's statement (*Science*, v. p. 13), that an annual rainfall of eighteen inches is entirely inadequate to maintain successful agriculture, is, I suppose, meant to apply only to Kansas, and, with that limitation, may be correct. In California, and especially in this portion of it, our experience is very different. Properly distributed, a rainfall of ten inches is ample to mature the cereals, and excellent crops are frequently raised with less. In the season of 1881-82 this place had 4.89 inches of rain, and there was an almost complete failure of crops, except on irrigated land. In 1882-83 there were 5.86 inches; and the distribution could hardly have been worse, almost all the rain falling after the 26th of March. Even under such circumstances there was some production on dry land, and the opinion was general that the crops would have been fair if the same amount of rain had come at the proper times. Last year the rainfall was almost unprecedented, reaching 18.32 inches. It was altogether too much. The crops were good, but they would have been far better if the last inch or two had been omitted. Of course, under different conditions of soil and climate,
